Methane to Markets

PETROLEUM
TECHNOLOGY
ALLIANCE
CANADA

PTAC

Bulk DEA Systems

- Rich amine from all absorbers goes to common flash and then sent to a single regenerator
- Goal of audit is to optimize units so that energy costs are at a minimum and performance of absorbers and exchangers is more consistent

CETAC-WEST

Environment
Canada

Environnement
Canada

Methane to Markets

Operating Data

	HP FEED	MP FEED	LP FEED
H ₂ S	16.6921	29.9894	6.1281
CO ₂	5.2833	6.4650	0.4348
COS	0.0030	0.0060	0.0025

- current HP flow is 61 MMSCFD
- original design flow to the HP absorber was 150 MMSCFD
- looking at a production decline curve of 14% per year
- equipment turndown issues at current and proposed rates
- in-plant and third-party audits had already been undertaken - plant expected minimal energy savings from audit**

Plant Assessment

- Current performance corresponds to a rich loading of 0.532 mol/mol - room for optimization??
- Energy optimization in amine units is primarily achieved by a reduction in circulation rates

CETAC-WEST

Environment
Canada

Environnement
Canada

Methane to Markets

PETROLEUM
TECHNOLOGY
ALLIANCE
CANADA

PTAC

Recommendations for Optimization

- Combination of circulation rate reduction and solution strength increase (with an understanding of allowable rich solution loadings) is the basis for the audit team's recommendations for new operating parameters

CETAC-WEST

Environment
Canada

Environnement
Canada

Methane to Markets

Optimization Steps

- Increase in amine strength from 28.5 wt% to 32 wt%
 - 12% reduction in circulation rate
 - leads to an expected reduction in steam of 18 600 lb/hr
- Further 7% reduction in circulation rate possible with increase in rich loading to 0.57 mol/mol (case sensitive)
- Expected additional steam savings of 8 700 lb/hr for a total savings of 27 300 lb/hr

CETAC-WEST

Environment
Canada

Environnement
Canada

Methane to Markets

PETROLEUM
TECHNOLOGY
ALLIANCE
CANADA
PTAC

Result of Changes

- No equipment changes; no new equipment
- After making suggested circulation rate reductions and strength increase, the plant reported the following improvements
 - Steam reduction from 126 000 to 111 000 lb/hr – estimated savings of >\$500 000/yr
 - Treated gas H₂S specification consistently lower than historical

What Makes This Case Study Interesting?

- Multiple Technologies

- Combining technologies for a single result

- Potential for Synergies

- Energy savings through unit integration

- Trade-off of Different Energy Forms

- Energy consumption, high and low unit energy costs

CETAC-WEST

CANADA

PTAC

Situation

- LPG recovery by
 - Propane Refrigeration and Lean Oil Absorption
 - Typically use either, rarely use both
- Propane condensing by two technologies
- Two forms of energy use
 - 1300 hp (Refrigeration) + 37 MMBTU/hr (Absorber)
 - \$3 million/year

CETAC-WEST

Environment
Canada

Environnement
Canada

Methane to Markets

PETROLEUM
TECHNOLOGY
ALLIANCE
CANADA

PTAC

Audit Findings

- Plant running at 1/3 of design feed
 - Equipment oversized
- Opportunities to improve refrigeration Coefficient of Performance
 - Minimize compressor discharge in winter
 - Add economizer
- Poor efficiency in Lean Oil Absorber
 - Lean Oil composition too vague
 - Tray type? Tray damage?
 - Poor gas/liquid distribution?

CETAC-WEST

Environment
Canada

Environnement
Canada

Methane to Markets

PETROLEUM
TECHNOLOGY
ALLIANCE
CANADA

PTAC

Opportunities

- Optimize individual units and **combined** operation of Refrigeration Unit & Lean Oil Absorber
 - Lower Chiller temperatures in Refrigeration Unit
 - Reduce lean oil circulation rates
- Achieve overall energy savings of \$1 million/year (33%)
 - Use electrical energy more effectively to save fuel use
 - 1/3 of savings through unit integration synergy
- Small capital investment
 - Economizer
 - Absorber internal/packing

CETAC-WEST

Environment
Canada

Environnement
Canada

Methane to Markets

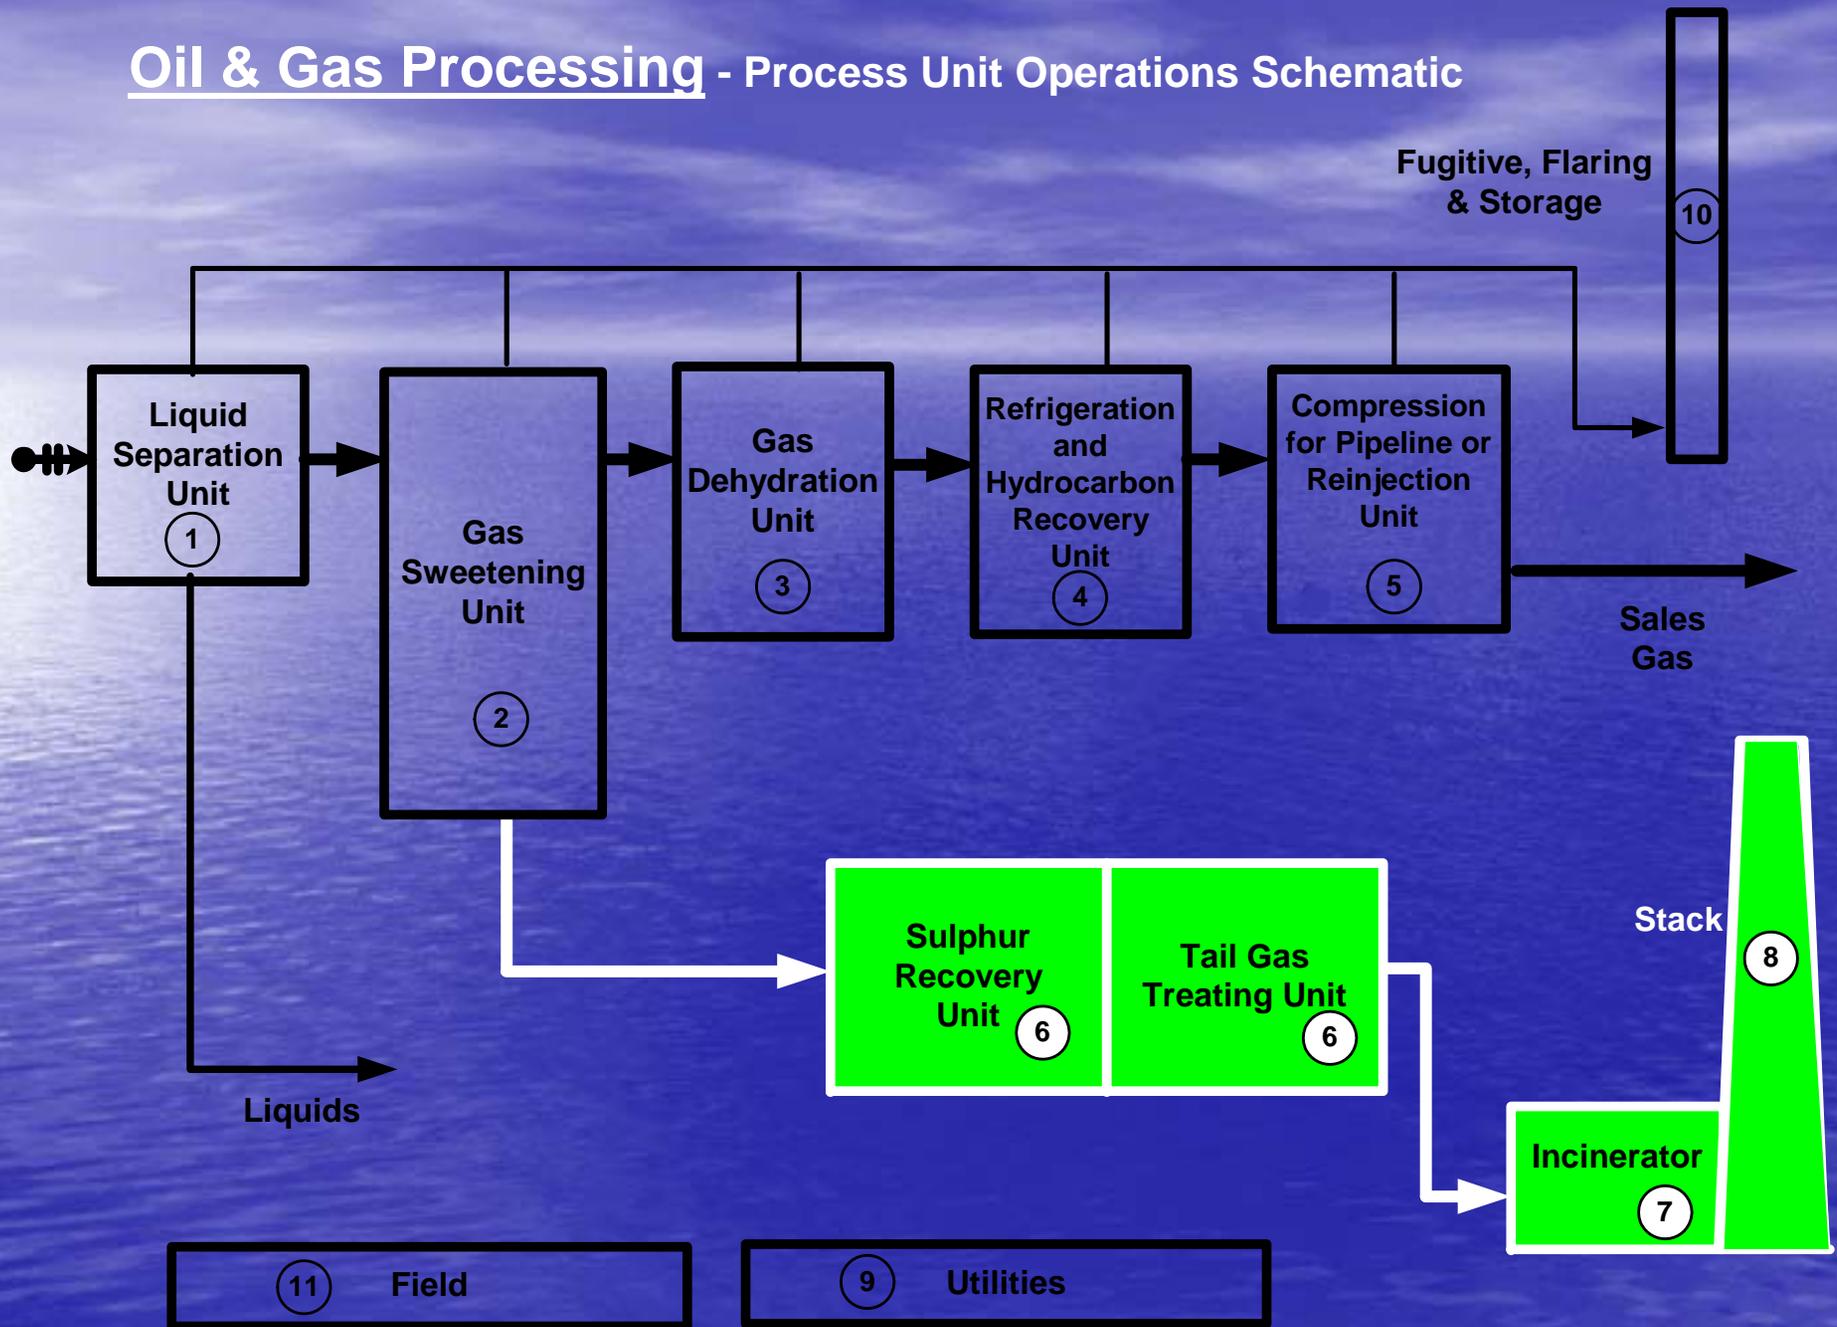

PTAC

Follow-Up Actions

- Confirm the opportunities
 - Computer simulation to confirm current and predicted operation
- Engineering design of required modifications
- **Update operating procedures to reflect new situation**

Environnement
Canada

Methane to Markets

PETROLEUM
TECHNOLOGY
ALLIANCE
CANADA

PTAC

Tail Gas Incineration Findings

- Attainment of Total Reduced Sulphur destruction requires high excess oxygen
- Stack top temperature is much higher than current sulphur inlet loading requires
- One third of the energy available in the tail gas stream is not being utilized in the incinerator

CETAC-WEST

Environment
Canada

Environnement
Canada

Methane to Markets

PETROLEUM
TECHNOLOGY
ALLIANCE
CANADA

PTAC

Tail Gas Incineration Analysis

- Incinerator performance is constrained by Total Reduced Sulphur destruction despite high oxygen level and high operating temperatures
- Lower Stack Top Temperature will not result in ground level SO₂ exceedences
- Performance is indicative of poor mixing of the tail gas within the incinerator

CETAC-WEST

Environment
Canada

Environnement
Canada

Methane to Markets

PETROLEUM
TECHNOLOGY
ALLIANCE
CANADA

PTAC

Recommendations - SRU

- Replace catalyst in first converter using titania-based technology to assist COS and CS₂ hydrolysis

CETAC-WEST

Environment
Canada

Environnement
Canada

Methane to Markets

PETROLEUM
TECHNOLOGY
ALLIANCE
CANADA
PTAC

Recommendations - Tail Gas Incinerator

- Replace existing natural draft burners with a high-intensity forced draft burner
- This will:
 - Improve mixing
 - Allow lower excess oxygen
 - Utilize energy from Tail Gas stream

CETAC-WEST

Environment
Canada

Environnement
Canada

Methane to Markets

PETROLEUM
TECHNOLOGY
ALLIANCE
CANADA

PTAC

Recommendations - Tail Gas Incinerator

- Apply for a tiered license based upon sulphur inlet loading
- This will:
 - Allow Stack Top Temperature to be reduced and more closely match Total Reduced Sulphur destruction required

CETAC-WEST

Environment
Canada

Environnement
Canada

Methane to Markets

Projected Energy Reductions

- Incinerator fuel gas can be reduced by 48% in total
- This will be achieved by:
 - Improved mixing – 22%
 - Lower excess O₂ - 9%
 - Lower Stack Top Temperature – 17%

CETAC-WEST

Steam Case Study Economics

- At design a sulphur plant generated 50 MMBTU/hr exothermic steam at 250 psig and the amine plant utilized 40 MMBTU/hr at 50 psig
- Back pressure steam turbines generated 1000 hp and an excess steam condenser balanced out the 10 MMBTU/hr difference

CETAC-WEST

Environment
Canada

Environnement
Canada

Methane to Markets

Steam Case Study Economics

- 30 years later, the sulphur plant now makes only 20 MMBTU/hr and the amine plant needs only 20 MMBTU/hr
- In order to keep the steam turbines running, they need 30 MMBTU/hr of steam from the auxiliary boiler
- The auxiliary boiler needs to be retired or replaced

CETAC-WEST

Environment
Canada

Environnement
Canada

Methane to Markets

PETROLEUM
TECHNOLOGY
ALLIANCE
CANADA

PTAC

Steam Case Study Economics

- This is a common problem faced by older sulphur recovery plants when the exothermic aspect of the sulphur plant is no longer sufficient to meet the steam turbine requirements

Condensing Turbine

CETAC-WEST

Environment
Canada

Environnement
Canada

Methane to Markets

PTAC

- When the plant was built, the steam turbines were a good choice since the sulphur plant produced steam at 250 psi but the amine plant only required steam at 50 psi
- Taking the pressure drop across a turbine produces essentially free energy

CETAC-WEST

Environment
Canada

Environnement
Canada

Methane to Markets

PETROLEUM
TECHNOLOGY
ALLIANCE
CANADA

PTAC

Steam Case Study Economics

■ Available Options:

- Install a new auxiliary boiler and install an extra 30 MMBTU/hr of excess steam condenser.
- Install the new auxiliary boiler and over-circulate the amine by a factor of 2 to condense the excess steam.
- Scrap the steam turbine, install 1000 hp of electric motors and let the sulphur plant balance the amine plant steam requirements.

CETAC-WEST

Environment
Canada

Environnement
Canada

Methane to Markets

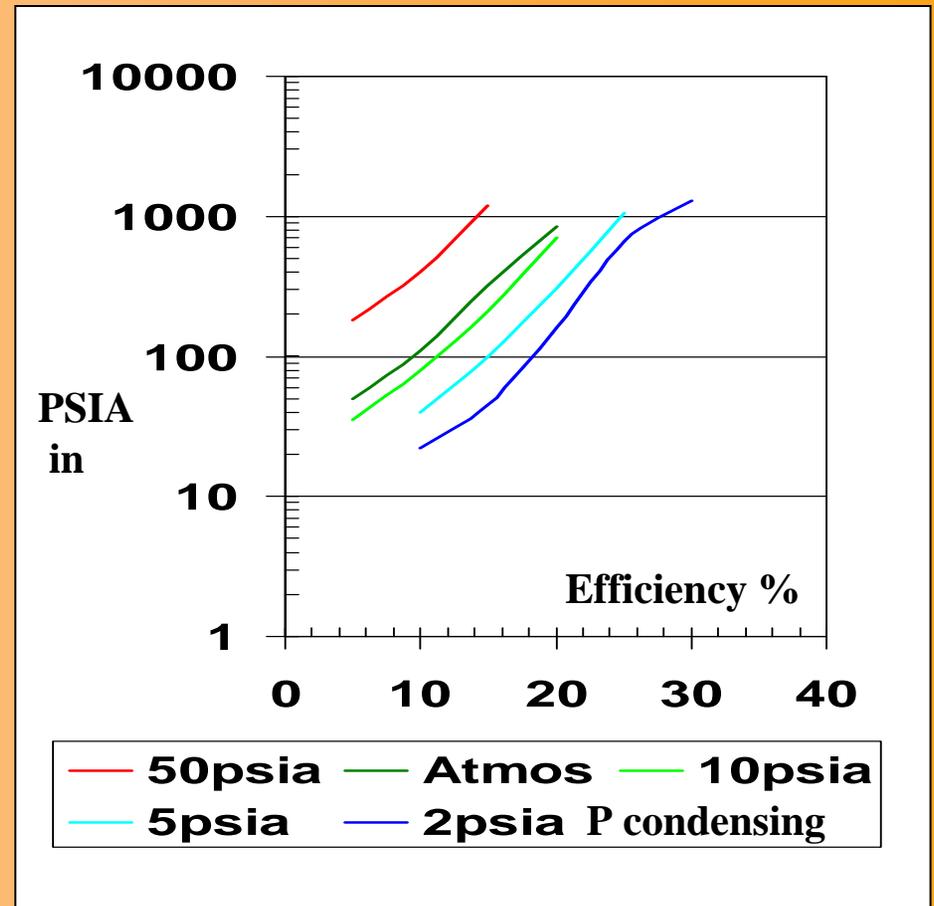

PETROLEUM
TECHNOLOGY
ALLIANCE
CANADA

PTAC

Steam Turbines

- Back pressure turbines are very inefficient (<15%) unless the exit steam is used for heat transfer.
- Condensing turbine efficiency can be quite good (>35%)
 - ...**IF** the steam pressure is very high and superheated and condensing pressure is very low.

Steam Case Options

	Action:	Capital Cost \$k	Annual Operating Cost \$k	3 Year Combined Cost \$k
1	Add Auxiliary Boiler and Excess Steam Condenser	1500	1650	6450
2	Add Auxiliary Boiler and over circulate Amine	900	1860	6480
3	Remove Steam Turbines and install electric motors	60	390	1230

Assumptions:

**Fuel @ \$6 per MMBTU
Electricity @ 6c per kWh**

PETROLEUM
TECHNOLOGY
ALLIANCE
CANADA
PTAC

Conclusions

- When process conditions change, the original design may no longer be appropriate
- Continuing to operate “the way we always have” can be an expensive option
- The cost of fuel gas must be considered in evaluating alternatives

Case Study

Gas Plant Facility in Central Alberta

■ Background

- Fuel use cycling up
- Electrical use steady
- Production cycling down

- Energy audit and conservation initiatives implemented

- Energy Reduction of 15%

- But

- No system established / installed to monitor and target the energy use relative to production

CETAC-WEST

Environment
Canada

Environnement
Canada

Methane to Markets

PETROLEUM
TECHNOLOGY
ALLIANCE
CANADA

PTAC

Set Up

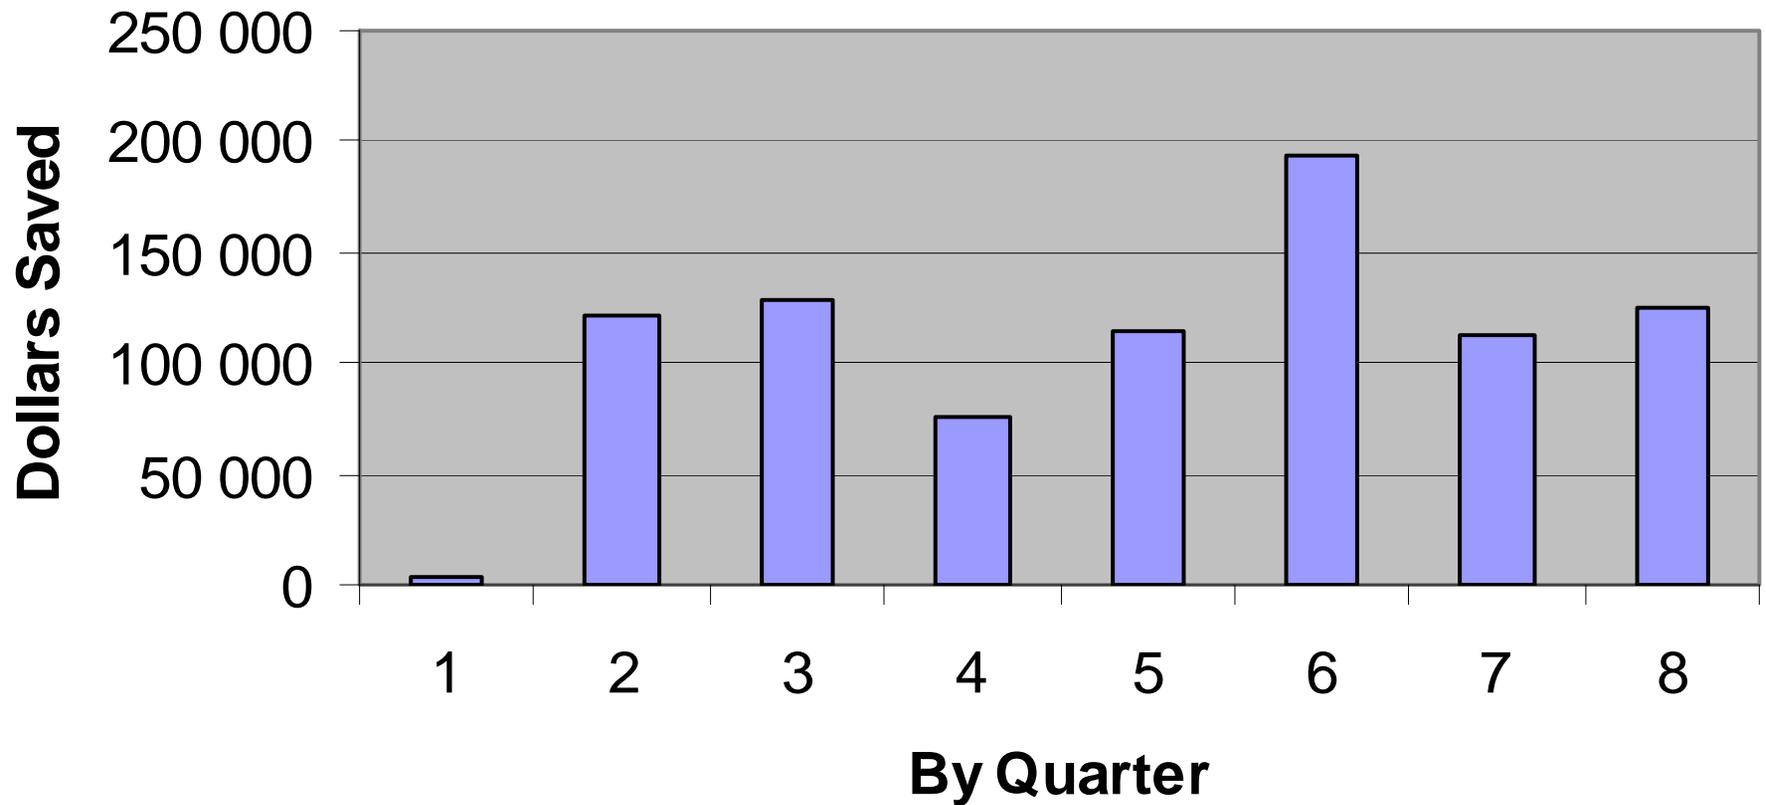

- Energy Champion appointed – Plant Lead Operator
- CUSUM introduced and steps performed:
 - Data collection (production, fuel gas, electricity)
 - Baseline selection
 - Correlations for predicting energy use variation
 - Estimate of difference in energy use
 - Cumulative summation of differences

Actions

■ Energy Champion

- Recorded readings daily (part of existing log reporting)
- Looked for changes in direction (~10 minutes per day)
- Consulted with operating staff (part of daily meeting)
 - Determined what caused the change
 - Eliminated improper actions
 - Replicated beneficial actions
- Communicated results

Savings by Quarter

Summary

■ Significant economic savings

- Identified energy savings were **9-20% (\$400 to \$900K)** compared to baseline performance
- **Cost to Implement - \$20,000 plus noted Lead Operator time**

■ Simple Payback: 1.2 to 2.6 weeks

CETAC-WEST

Environment
Canada

Environnement
Canada

Methane to Markets

Summary

■ Greater retention of savings

- Lack of M&T can erase energy management gains
- CUSUM can hold, **and extend**, those gains

■ Greater ability to deal with 2 significant problems for Western Canadian operations

- Changing throughput
- Extremes of climate

■ Need to periodically update baseline

CETAC-WEST

PTAC

Summary

■ Change in operator view of energy management

■ Before

- Energy consumption is inevitable...
 - What can **We** do about it?

■ Now

- We can make a difference...
 - **We** can reduce our energy use.
- Selling concept to Field Operators

Environnement
Canada

Methane to Markets

PETROLEUM
TECHNOLOGY
ALLIANCE
CANADA
PTAC

Why Target Natural Gas Losses and Fugitive Emissions?

- Sensible means of reducing greenhouse gas (GHG) emissions in a transparent and verifiable manner
 - Cost-effective control opportunities based on value of saved gas
 - Typically low capital cost of controls
 - **“Low hanging fruit”**
 - High GHG intensity
 - **Global warming potential $\text{CH}_4 = 21.0 * \text{CO}_2$**
 - Measurement of baseline GHG emissions – may become important for GHG trading programs

Facility Description

■ Sour compressor facility

- continuously manned
- 1 turbine compressor
- 5 reciprocating compressors
- 2 dew point control trains
- 2 flare systems

- Equipment components surveyed: 5 471

CETAC-WEST

Environment
Canada

Environnement
Canada

Methane to Markets

PETROLEUM
TECHNOLOGY
ALLIANCE
CANADA

PTAC

Emission Survey Findings

■ Fugitive emissions

- **84 leakers identified, 25 cost-effective repairs**
- **3 largest leakers – 3 170 x 10³ m³/yr in losses**
 - recip. start gas vent \$587 000/yr
 - packing case vent \$ 82 000/yr
 - packing case vent \$ 75 000/yr
- **Total identified losses: 3 200 x 10³ m³/yr**
- **Fugitive GHG emissions: 43 600 tonnes CO₂E/yr**

CETAC-WEST

Environment
Canada

Environnement
Canada

Emission Survey Findings

■ Flared gas

- Excessive flaring observed
 - blowdown valve partially open
 - Source eliminated during visit

■ Potential savings for site:

- GHG emissions 43 500t CO₂E/yr
- Avoided natural gas losses \$ 755 000/yr
- 99% of emissions avoidable at NO NET COST

CETAC-WEST

Environment
Canada

Environnement
Canada

Methane to Markets

Recommendations & Deliverables

■ Recommendations:

- Undertake cost-effect repair opportunities
- Install flow indicators on compressor vents – early detection of leakage problems
- Install monitoring ports on flare system – periodic checks for leakage into flare header

■ Deliverables:

- Ranked listing of identified control opportunities
- Cost-curve for reduction of natural gas losses
- Baseline emissions inventory

CETAC-WEST

Environment
Canada

Environnement
Canada

Emission Reduction Opportunities:

KEY FEATURES

- Opportunities greatest at older and un-manned facilities
- Lack of reliable visible or audible indicators
- Emissions occur at elevated or difficult to access locations
- Lack of measurement data
- Typically 70-80% of fugitives are cost-effective to control
(less than 1 year paybacks)
- Most fugitive emissions result from fewer than 10 sources per site**

CETAC-WEST

Environment
Canada

Environnement
Canada

Methane to Markets

In conclusion...

- Significant financially attractive opportunities to control natural gas emissions do exist
 - Can be overlooked or understated in absence of reliable measurement or estimation results
- Opportunities would not be quantified without an audit
- Fugitive emission reduction opportunities are worth pursuing from a GHG perspective
 - High GHG intensity of CH₄

Integrated Plant Audit

Requires:

Unit by unit expertise

Multi-disciplinary approach

Concurrent effort
