

GOSAT

(Greenhouse gases Observing SATellite)
(IBUKI: breath in Japanese)

Prof. G. Inoue, RIHN
GOSAT Chief Scientist
Research Institute of Humanity and
Nature, inouegen@chikyu.ac.jp

***Dr. K. O'hashi, JATIS**

****Dr. T. Yokota, NIES**

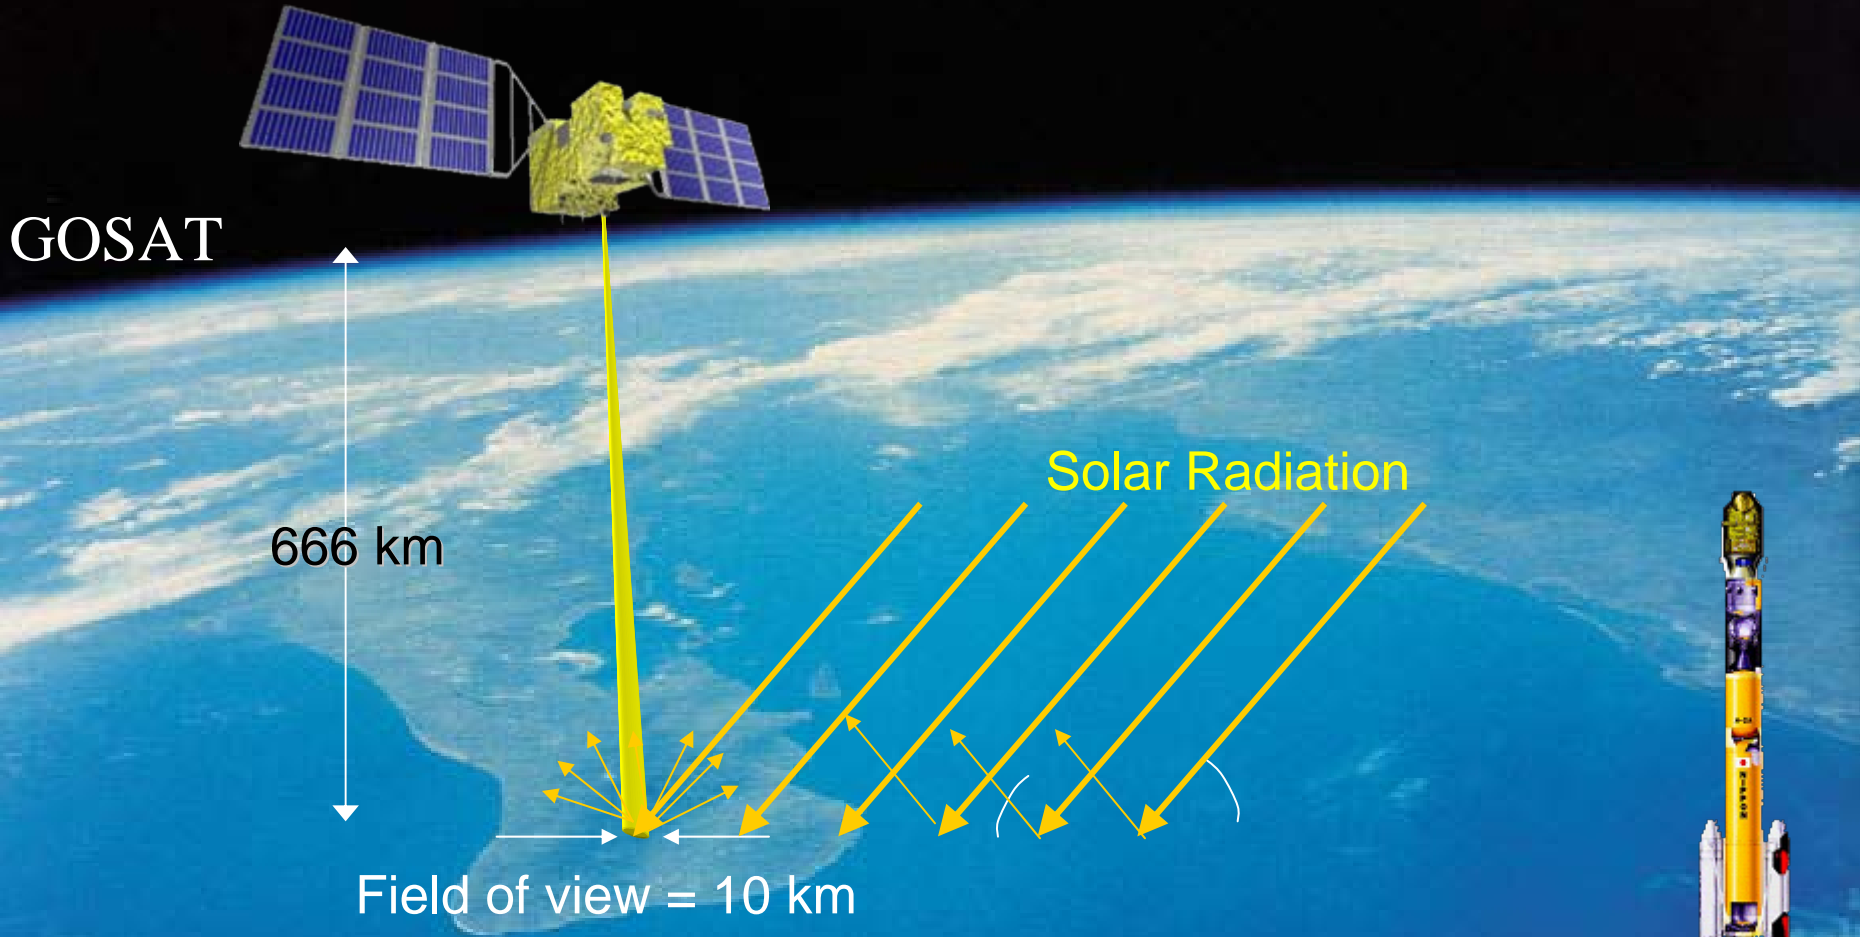

- (A) GOSAT ; present stage
 - (a) Pointing mechanism : target mode operation
 - (b) Spectral analysis ; 2D-CH₄ distribution
 - (c) Some examples ; India and China
- (B) Three Steps for Monitoring of CH₄
 - (a) GOSAT data
 - (b) Remote sensing observation from Aircraft
 - (c) Ground measurement

Launch of GOSAT

GOSAT was launched from Tanegashima (Launch Site) by H2-A rocket on 23rd January 2009.

GOSAT

666 km

Solar Radiation

Field of view = 10 km

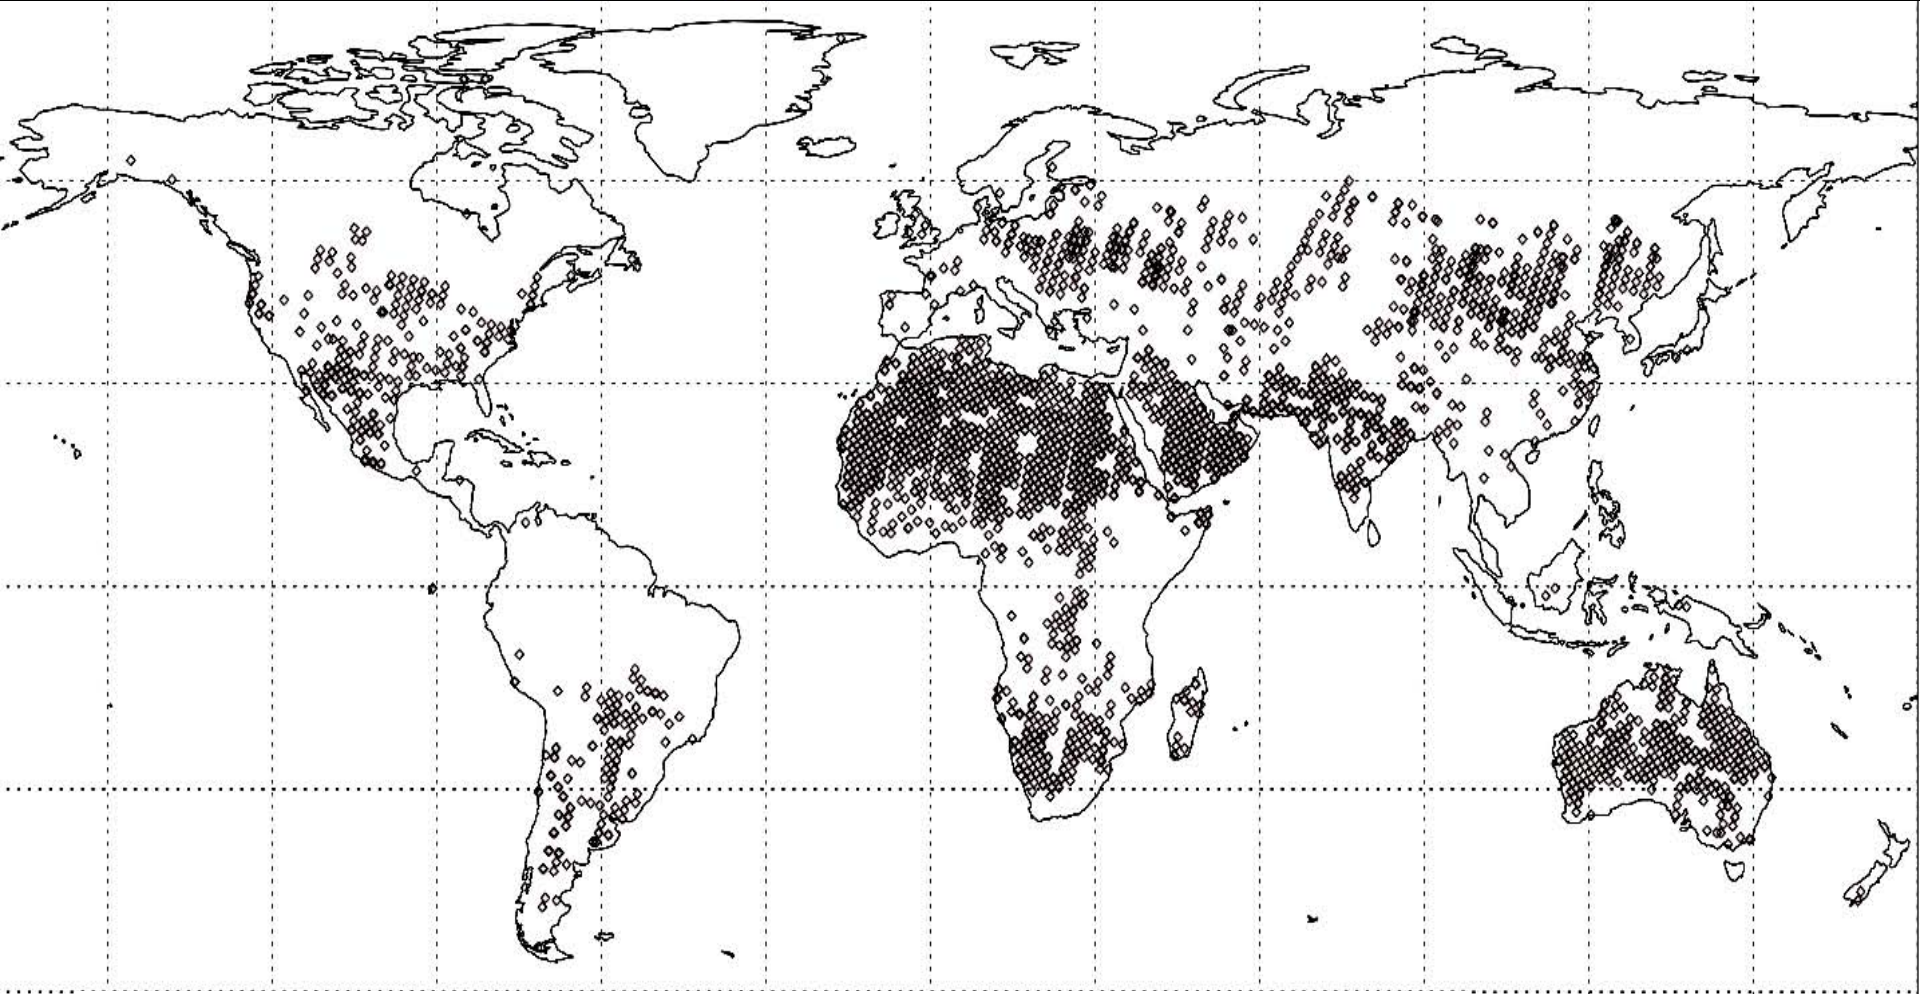

GOSAT observes the column amount of CO₂ and Methane.
Column amount = total amount of gas from surface to space.
Not the concentration itself.

CAI Image & Cloud flag Image

April 23, 2009
Japan area

*Nine days clear sky data points
in April, 2009*

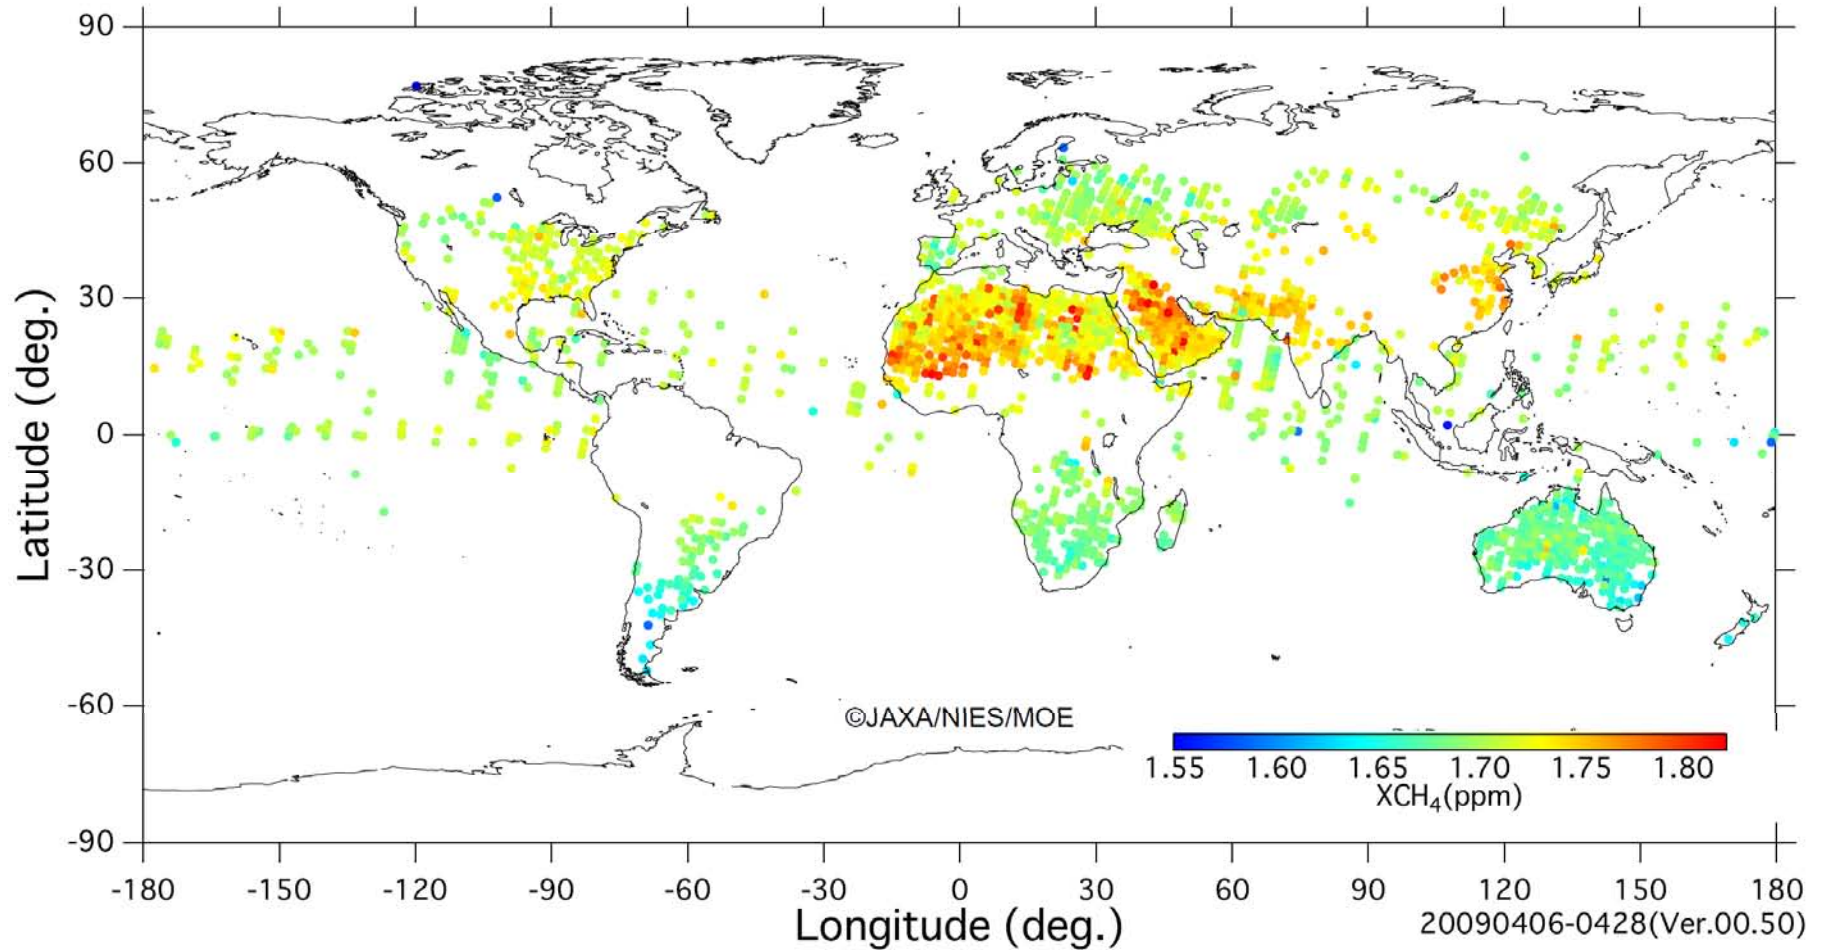

Observed and Simulated Spectrum of CH₄

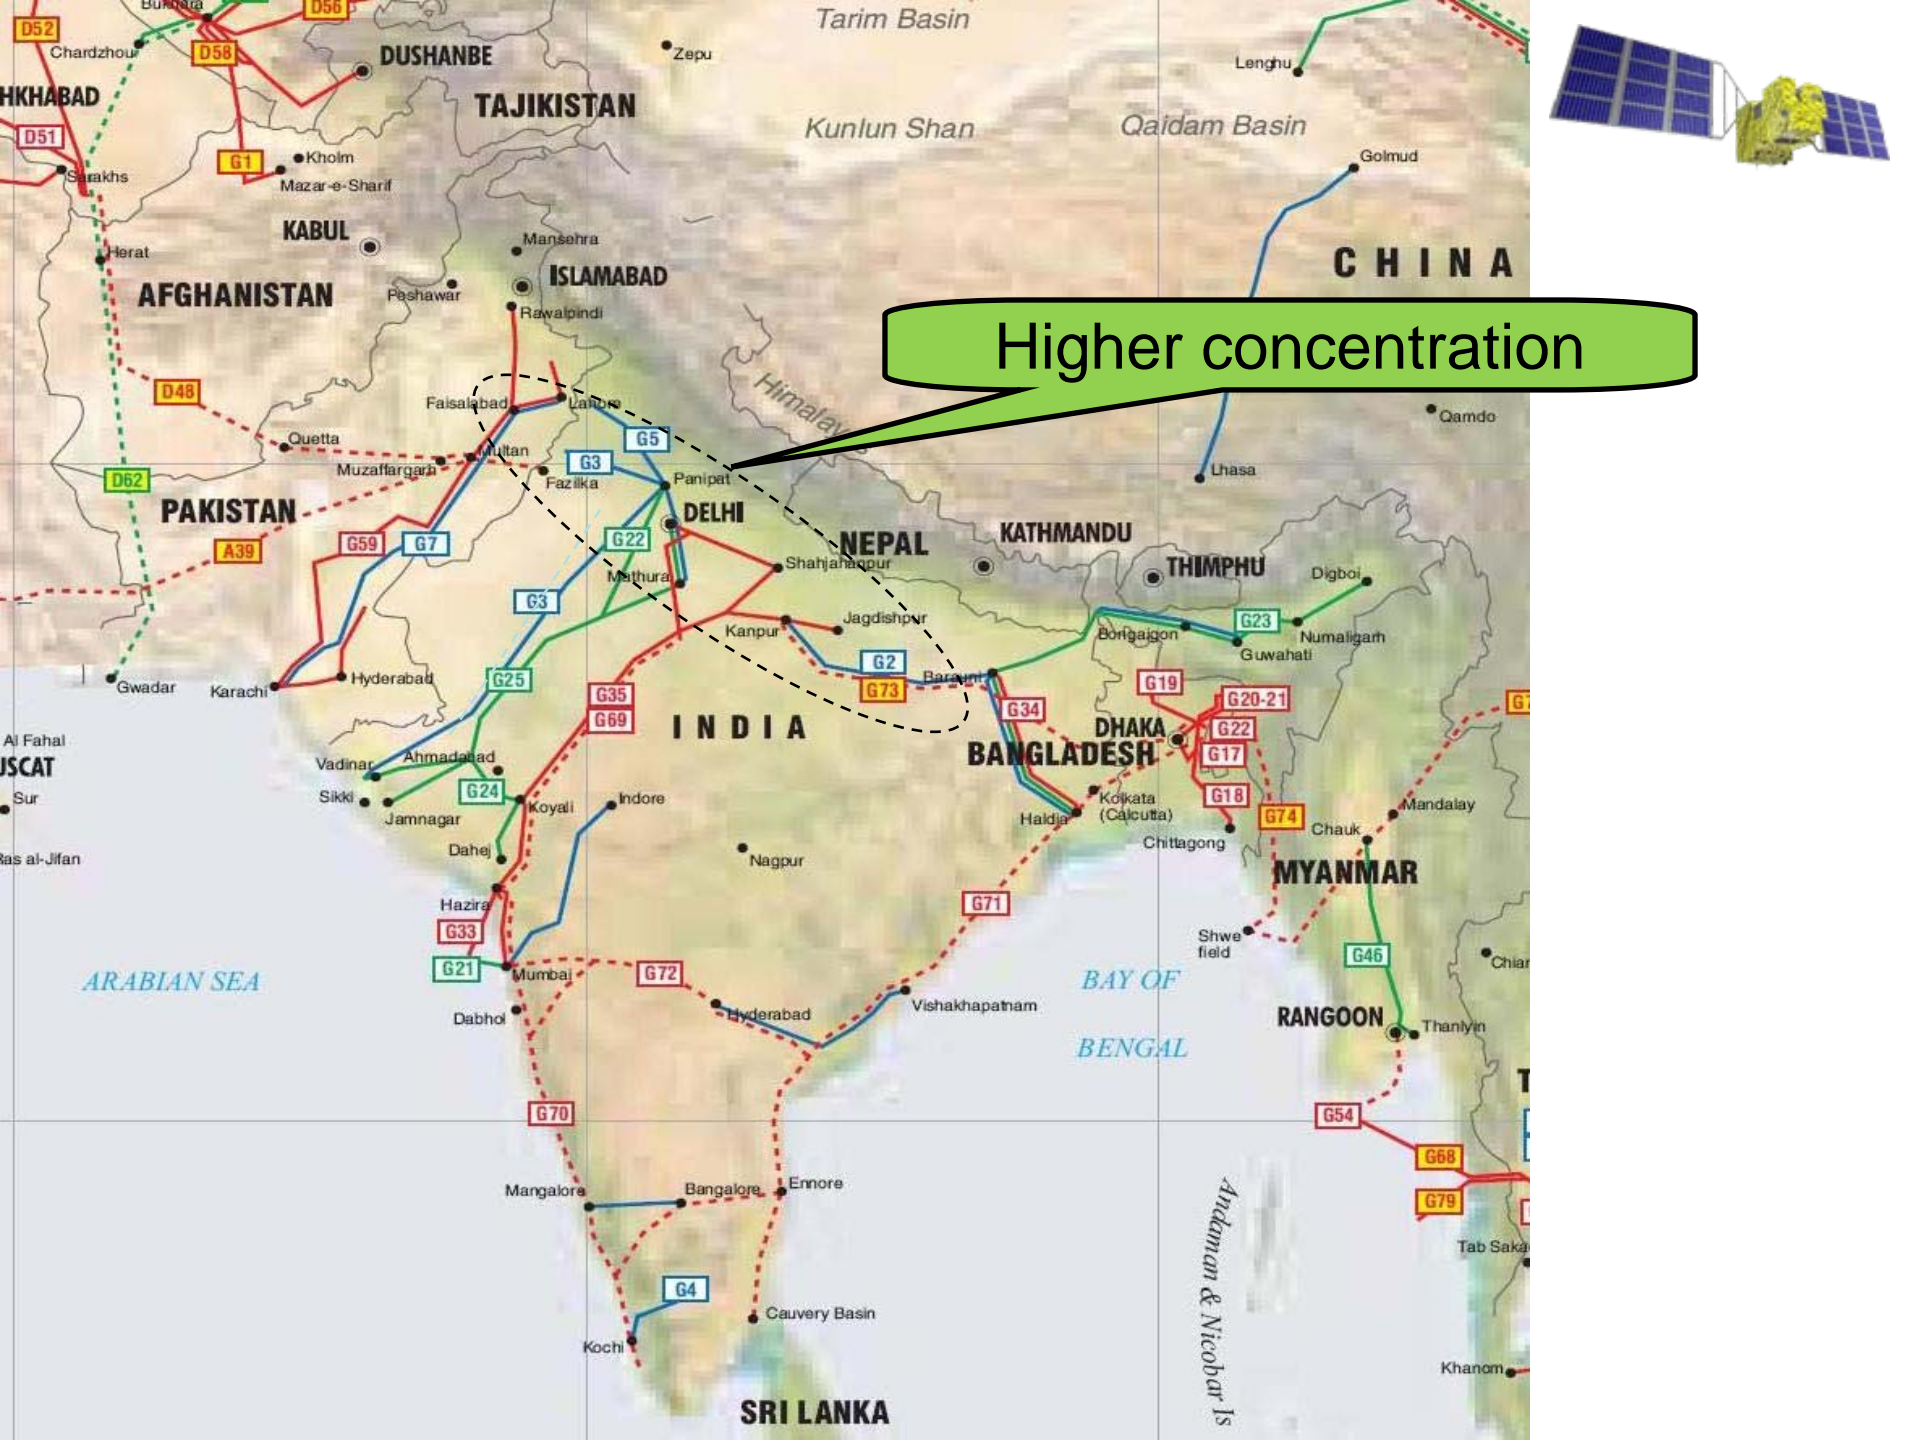

— Simulated — Observed

Nine days composite of CH₄ column concentration in April, 2009

Higher concentration

The conversion of monsoon wind climbing along Himalaya makes the column amount high collecting the emitted GHG along the course.

XCH₄

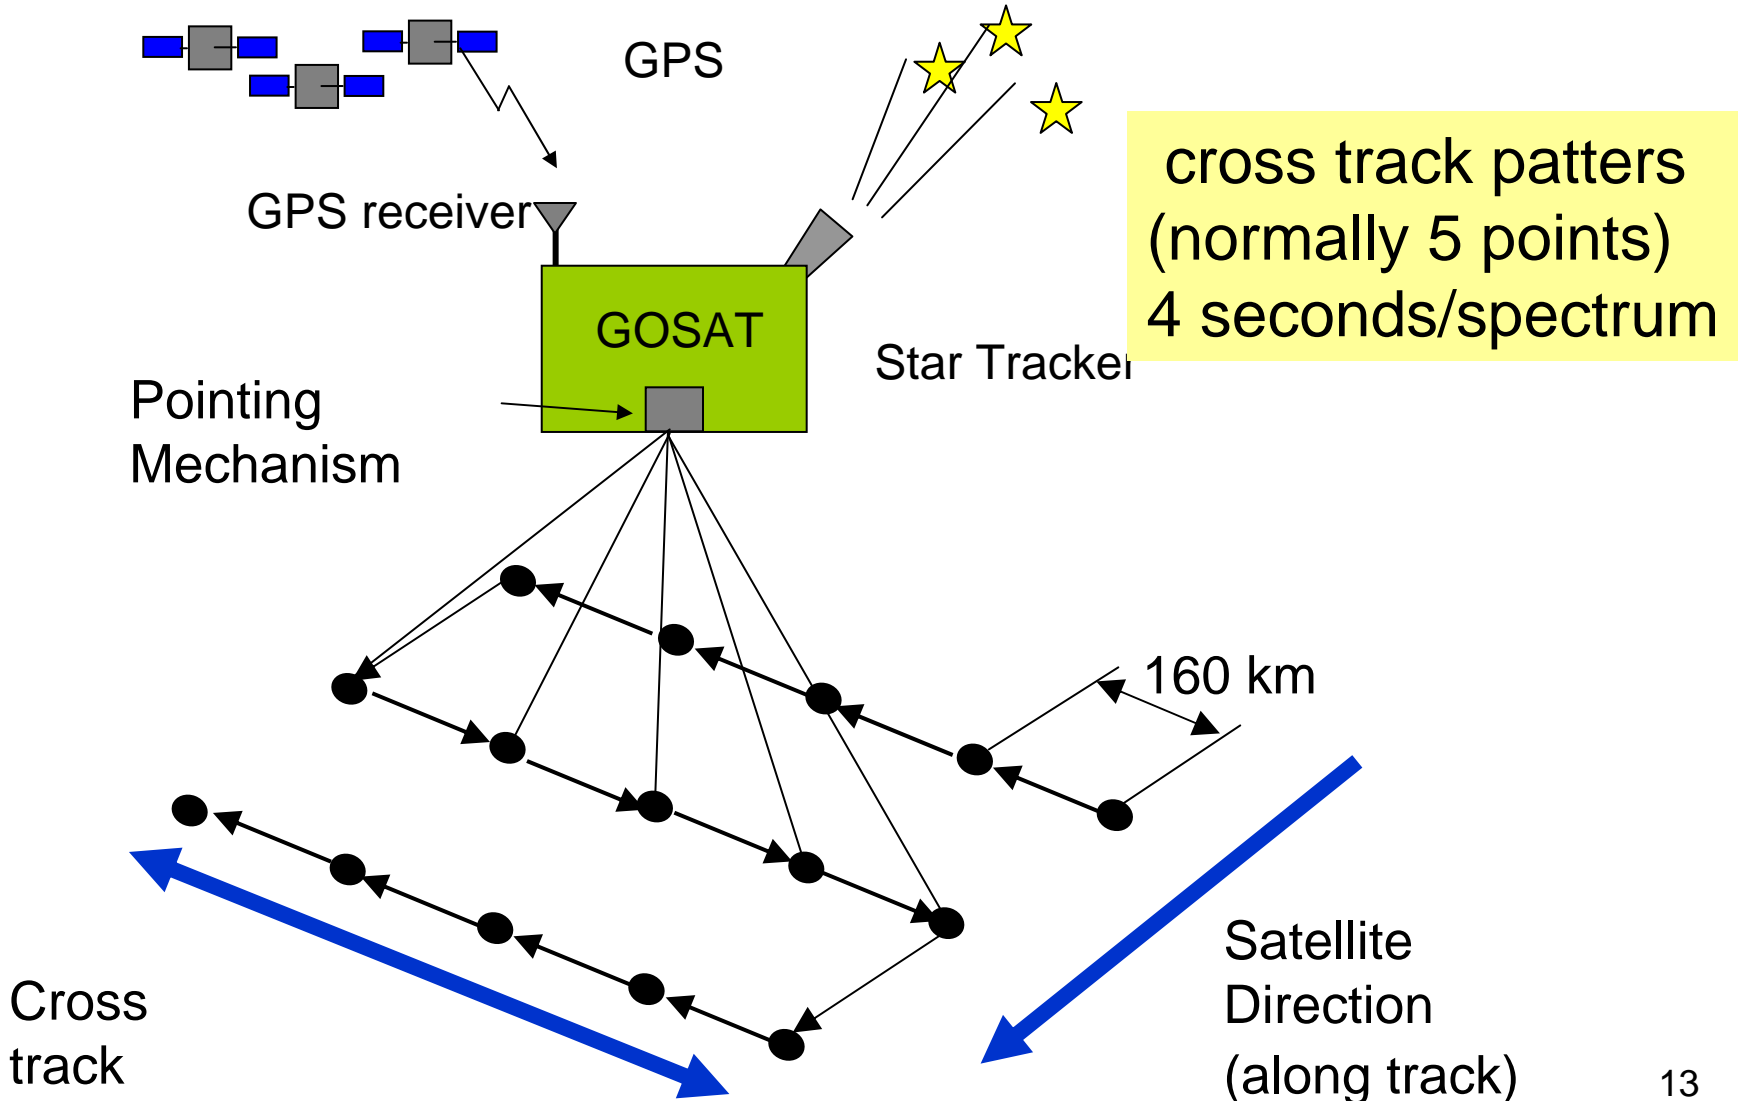

- ▲ Oil & Gas
- ▲ Coal
- Rice

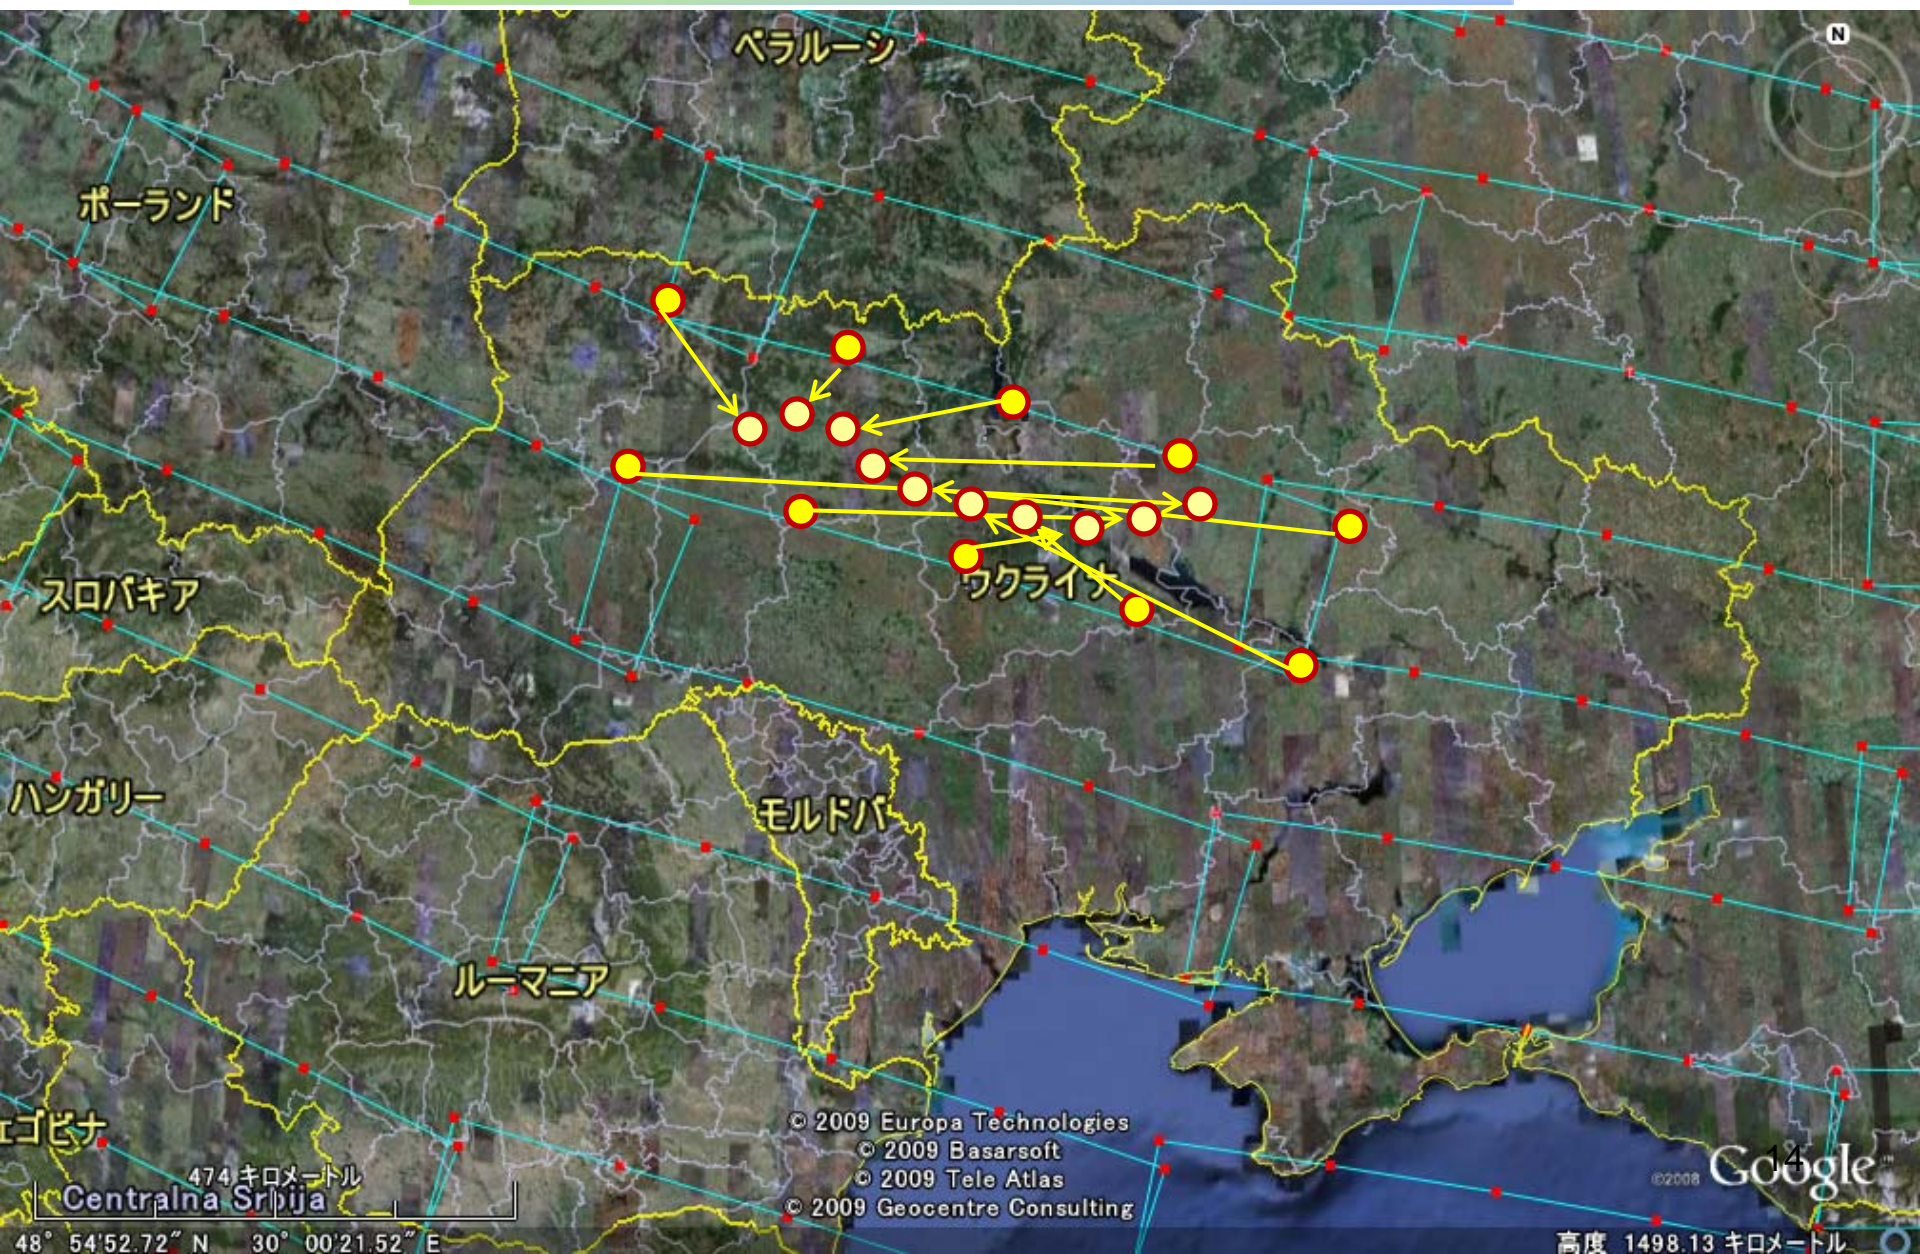

How to apply GOSAT data
to the pipeline / gas-mining sites?

Foot prints in normal observation mode

Operational 5-points mode to Target mode

Three Steps Monitoring of CH₄

Stage 3	1 st	2 nd	3 rd
Steps	GOSAT	Sky-ship	Inside Station
Monitoring Items	Identification of leak	Location of leak points	Leaking source
Method	Satellite	Sky-ship+ Thermal viewer (or Lidar)	Thermal viewer
Frequency	Continuous Monitoring	On demand.	Planning of Rehabilitation
Resolution	10~1.000km	10~100 m	Pin Point

Leak rate from a composite source

C : Methane concentration at (h,x)

v : Wind velocity at (h,x)

$$F_{\text{total}} = \int C(h,x) v(h,x) dx dh$$

Lidar observation from Aircraft

Possible performance

Example of field observation

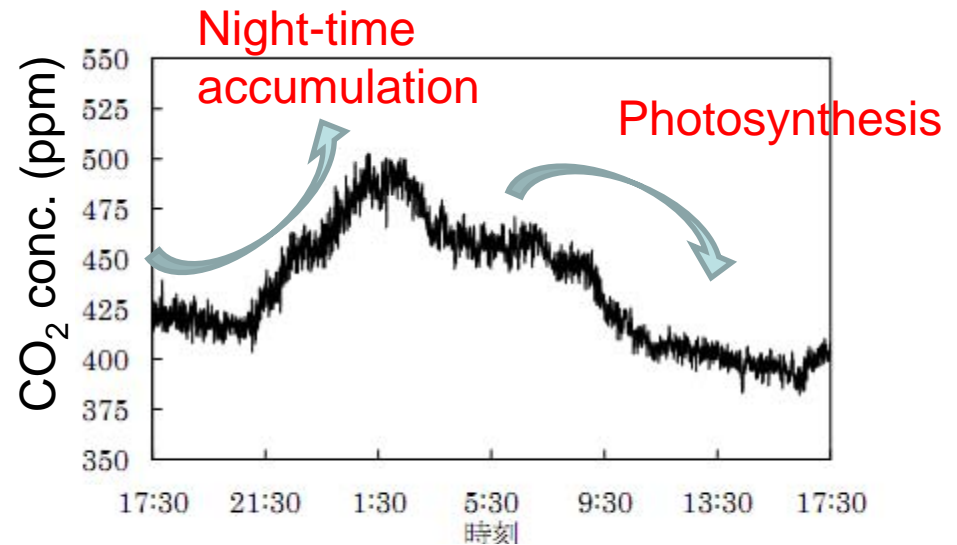

Photo of CO₂ system

Variation of CO₂ concentration observed by our DIAL system

- Target: CO₂ (at 400 ppm)
- Distance between LIDAR and Target: 1 km
- Averaging period: 32 sec
- Precision: 4 ppm (1% of background concentration)

Possible usage of GOSAT data

- The data is stored in a memory system, and down-linked at Norway and Japan only.
- FTS L1A data is processed together with the housekeeping data, and converted to L1B data (spectra) in a day by JAXA, which are transferred to NIES, and distributed to users.
- NIES convert them to L2 data (concentrations) in a week, using aerosol and cloud data from GOSAT TANSO-CAI and aerosol model, and concentration from model as the initial guess.
- We can obtain the concentration pattern rather than the concentration by a quick-view analysis.

1. Data is fully open and free of charge in R&D.
2. In order to access to the data in early stage, it is recommended to apply to the Research Announcement (RA).
3. Special Targeting Operation can be requested by the RA users only.
4. Above items are applied as long as it is the R/D stage. Profitable application is requested to compensate the cost necessary to handle the data set.

Sensitivity (GOSAT data use)

- The detectable leak rate is about 10 tCH₄/day.
 - (assuming averaged 5 m/hr winds)
- The spatial resolution is 10 km or more.
- One observation per three days if clear days continue.

Local Observation

- GOSAT was launched successfully.
- The quality of SWIR(NIR) bands spectra are excellent.
- The retrieved concentration patterns are reasonable for clear sky data.
- We hope GOSAT data would widely contribute to reduce the GHG emission.
