Leak Detection Practices & Demonstration of Optical Imaging

1st Asia Pacific Global Methane Initiative Oil & Gas Sector Workshop

September 23, 2011
Jakarta, Indonesia

Milton W. Heath III
Director, Environmental Services
Heath Consultants Incorporated
Agenda

- Remote Sensing – Detection over a path
  - Gas Plume Imaging – Active vs. Passive
  - Optical – TDLAS, ALMA, ANGEL, LDAR, OP-FTIR, UV-DOAS

- Examples of Commercially Available Aerial Leak Detection Products & Services Today

- OPGAL Eye-C-Gas Imaging Camera

- Gas Imaging Demonstration

- Contacts and Further Information
Why Is Infrared Gas Imaging & Laser Technology Needed?

Gas leaks pose several problems for producers, processors, transporters and distributors of refined petroleum and natural gas products:

- SAFETY – undetected gas can cause explosions or toxic poisoning of employees and neighbors
- ENVIRONMENTAL – GHG and regulatory compliance
- LOST REVENUES – material lost into the open air can not reach the market for sell

Gas leaks are invisible, odorless, and go unnoticed
Why Thermal Infrared Imaging

- **Actual practice** - utilize a gas detector with a wand-like probe and physically “sniffing” every component at a regulated facility called TVA (Toxic Vapor Analyzer). Highly time and human resource consuming.

- **Thermal infrared imaging** - identify many more leaks much more quickly and given that any detected leak, regardless of the size of the leak (volume) must be repaired, also allows the operator to perfectly localize the source of the leak.
## Technology Overview – Plume Imaging

<table>
<thead>
<tr>
<th>Technology</th>

| TDLAS (Tunable Diode Laser Absorption Spectroscopy) | • One of the highest spectral resolutions of any method  
• With the use of fiber optics, a number of measurements can be performed at remote locations simultaneously | • Separate diode laser must generally be used for each gas  
• Pipelines Under Water, Lakes & Rivers  
• Pipeline Inspections in Deep Snow with Ice Cap. | • Pipeline transmission right of way and distribution gas pipeline compliance leak surveys  
• All above ground piping  
• Mobile Leak Surveys |
| LIDAR (Light Detection and Ranging)     | • Maps the location of chemicals over a wide region up to 80 km  
• Time resolution allows good spatial resolution | • Tuned to evaluate one pair of wavelengths at a time, not multiple components  
• Complex, large, expensive systems, which require highly skilled personnel  
• Can be impacted by meteorology | • Industrial processes  
• Mobile source emissions  
• Airport Emissions  
• Urban air quality  
• Ambient air quality |
| OP-FTIR (Open Path Fourier Transform Infrared) | • Identify, measure, and speciate 100+ compounds simultaneously from 500 to 1000 meters  
• Good for VOC identification.  
• No spectral losses due to dispersion or reflection, since it uses an interferometer | • Requires a large number of calibration runs  
• Technical savvy operator needed.  
• Presents poor sensitivity for aromatic compounds due to water vapor interference  
• Impacted by water/water vapor | • Urban air pollution  
• Industrial fence line  
• Airport monitoring  
• Traffic monitoring  
• Stack monitoring  
• Ambient air quality |
What does Active Plume Imaging Look Like?

- Real-time detection of methane leaks
  - Quicker identification & repair of leaks
  - Screen hundreds of components an hour
  - Screen inaccessible areas simply by viewing them

Source: Heath Consultants
Remote Methane Leak Detection

- Works using Tunable Diode Laser Absorption Spectroscopy (TDLAS)
- Specific to methane gas only
- Displays gas reading in parts per million metered
Aerial Pipeline Surveys

- Over 10 times faster than ground surveys
- Full coverage of the right-of-way
- Easy access to rough terrain and non-disruptive to private land owners

Atmosphere  Methane

Reflected Signal

Underground Pipeline

Global Methane Initiative
Aerial leak surveys with infrared leak detection devices can aid in leak identification over large sections of pipelines.

Aerial surveys can be conducted in helicopters or fixed wing aircrafts using both active and passive IR detection devices.

Airborne Laser Methane Assessment (ALMA) by PERGAM-SUISSE
The Basic Principle

Optical Unit:
- Laser
- Mirror
- Reference Channel

- The laser hits a gas cloud
- The energy is absorbed as a function of the gas concentration.
- Less laser light is reflected
- The signal is weakened
We always fly downwind from the pipeline
New Era Technology, Inc.
Aerial Leak Detection & Surveys

Option to Purchase the Plane and Detection Platform or Purchase the Service.
Partner Experience – Chesapeake Energy

- Sept. 2008 flight covered 616 miles
- To cover the same area with ground patrol:
  - 4 men: 2 men on 2 crews 2 vehicles and fuel
  - 6 hours / day
  - 6 miles / day
- Result: 100 days, 3,200 man hours, 5 months of detection
- Flight time was 65 hours
- Real savings in man hours, time, and vehicle fuel
DCP Midstream faced with surveying their 66,000 mile "spaghetti" like pipelines

Contacted LaSen Inc. to use their laser remote sensing application on DCP’s gathering lines.

DCP reported LaSen’s surveys cover 50 to 100 miles per day

Since working with LaSen, DCP has reduced it’s unaccounted emissions by 50 %
ITT’s Aerial Leak Detection Lidar (ANGEL) Service

- DIAL Sensor
- Digital Video Camera
- High Resolution Mapping Camera
Aerial Leak Detection – Emission Rate Quantification

- Airborne Differential Absorption Lidar (DIAL)

Consider a “fenceline” 100-ft high by 100-ft wide (10,000 ft\(^2\))
- At a wind speed of 2 mph = 10,560 ft/h, \(1.056 \times 10^8\) Std-ft\(^3\)/hr of air flow across that fenceline under standard conditions
- If the air contains 1000 ppm of methane on average (0.1%), then the methane flow is 105,600 SCFH = 2545 MSCF/D
OPGAL: EYE-C-GAS
Fugitive Emissions Detection Camera

• A design formed by the demands of the industry.

• Specially designed for the applicative market of natural gas, oil and petrochemical industries.

• Design for intrinsically safe, allowing the inspection at hazardous places in the plant.
How The Eye-C-Gas Camera Works

- The leaking gas temperature differs from the background temperature,
- The EYE-C-GAS™ camera spectral band coincides with the emissivity (absorbance) spectra of the leaking gas,
- The sensitivity of the EYE-C-GAS™ camera enables the measurement of the difference in signal value, caused by the leaking gas
- EYE-C-GAS™ produces images of infrared energy and display it on a screen, similar to how a camcorder displays video.
What the Eye-C-Gas Camera Does

- Detects smaller leaks or leak sources that have minimal temperature contrast with enhanced imaging mode of operations.
- Implements an internal video and audio recording device.
- Features a large color LCD display for image and text display.
- Rugged and durable by design to be used as a tool in the field.
- The EYE-C-GAS™ includes a digital CCD camera for fast recognition of the components being inspected or leaking for video recording.
EYE-C-GAS™
